

***The Effect of Finishing Techniques on
Marginal Adaption and Surface Morphology
of Three Glass Ionomer Cements***

*by Esam A. Nagilib, B.Ch.D., M.S.D. and Timothy J. Carlson, D.D.S.,
M.S.D.*

Three formulations of glass ionomer filling materials were finish with discs lubricated with either water or petroleum jelly. No changes in surface micromorphology or marginal adaptation were found which would indicate indicate petroleum jelly should be used as a lubricant during finishing instead of winter.
