

## Research Details :

Research Title	: <u><i>Infundibular buckling as an adjunctive sign of Pituitary adenoma</i></u> <u><i>Infundibular buckling as an adjunctive sign of Pituitary adenoma</i></u>
Descriptipn	: Pituitary adenomas comprise up to 25% of central nervous system tumors.1 Magnetic resonance imaging (MRI) usually makes an accurate diagnosis with the finest possible details. Infundibular displacement is a well-known sign following the development of computerized tomography (CT), however, we are unaware of any description of infundibular buckling. Recently, we encountered a 39-year old male, who presented with the clinical picture of acromegaly and a high prolactin level. Growth hormone and somatomedin levels are high
